

Here are the exact step-by-step instructions to create a personal access token and link your GitHub repository to the workspace:

Step 1: Format the Repository Name

In the **GitHub Repository** input field, you must provide the repository path using the exact format: username/repository-name.

- **Example:** If your repository URL is https://github.com/AshuNewatia/CampusFlow, you should enter **AshuNewatia/CampusFlow**.
- Do not include https://github.com/ or trailing slashes.

Step 2: Navigate to GitHub Developer Settings

To allow the workspace to sync cards with repository issues, you need to generate a secure access token on GitHub:

1. Log into your GitHub account.
2. Click your profile picture in the top-right corner and select **Settings**.
3. Scroll all the way down on the left sidebar and click on **Developer Settings**.
4. In the left sidebar, click **Personal access tokens**, then select **Tokens (classic)**.

Step 3: Generate the Classic Token

1. Click the **Generate new token** dropdown menu on the top right and select **Generate new token (classic)**.
2. In the **Note** field, give your token a descriptive name so you remember what it is for (e.g., CampusFlow-Workspace-Integration).
3. Under **Select scopes**, look for the **repo** checkbox. **Strictly check the repo scope box.** (This grants the workspace permission to read project data and manage repository issues).

Step 4: Copy and Save the Token

1. Scroll to the bottom of the GitHub page and click **Generate token**.
2. **Important:** Copy the generated token immediately (it will start with ghp_). GitHub will never show this code to you again once you leave the page.
3. Return to your workspace settings panel, paste the copied string into the **Personal Access Token (Classic)** field, and click **Save Changes**.
